The Role of lexical Analyzer

- · It is the first Phase of Compiler Design.
- Basically it reads user input and produces a sequence tokens that is used in Syntax analysis by parser.

Ocaml for lexical analysis

- We used Ocaml language to write our lexer. The main advantage of using it is, we would be able to parse our complex data structure formats and hence being efficient in providing useful error messages which becomes a complex task otherwise.
- We have written the code for lexer in Ocaml in the file named lexer.mll. We execute the file with the command **ocamlex lexer.mll** that produces a lexical analyzer from a set of regular expressions with attached semantic actions, in the style of lex in the file **lexer.ml**.
- This file defines one lexing function per entry point in the lexer definition. These functions have the same names as the entry points. Lexing functions take as argument a lexer buffer, and return the semantic attribute of the corresponding entry point.

Overview of lexer.mll file

- This file contains the code written in Ocaml to parse the tokens (syntax, keywords, datatypes etc..)
- To give a brief idea of the non primitive datatypes that we added specific to our language include

• The tags implementation in our language as mentioned in the whitepaper requires additional tokens as below:

• This was the tokenisation part of our lexical analyser where the output briefly corresponds to set of strings(Identifiers, keywords, whitespace,Integer).

Working of lexer
